TITLE: Artificially-Curved, Prefabricated Reinforced-Concrete Troughs for Irrigation Chutes

PERIODICAL: Gidrotekhnika i melioratsiya, 1959, Nr 6, pp 6-14, (USSR)

ABSTRACT: The article describes an entirely new method to cast troughs for irrigation chutes, which calls for casting artificially-curved, prefabricated reinforced-concrete troughs. Developed by A.K. Shanshiyev of the Laboratoriya industrial'nogo gidrotekhnicheskogo zhelezobetona Tbilisskogo nauchno-issledovatel'skogo instituta sooruzheniy i gidroenergetiki imeni Vintera, or the TNISGEI, (Laboratory of Industrial Hydrotechnical Reinforced-Concrete of the Tbilisi Research Institute of Structures and Hydraulic Power Engineering imeni Vinter), the new method differs from the con-

Artificially-Curved, Prefabricated Reinforced-Concrete Troughs  
for Irrigation Chutes

ventional one employing a double mold insofar as it has only one mold, the bottom plate. Covered by a concrete layer with laid-in reinforcements and lifted by a transverse beam at four points, the bottom plate bends at a certain angle and remains in this state until the concrete mass hardens. Prior to lifting, the concrete layer with reinforcements is subject to vibration by a flat-type vibrator of the I-7-type. The new trough specifications are: upper width - 65 cm; depth - 40 cm; wall thickness at bottom - 4.5 cm; wall thickness at trough rims - 3 cm; trough length - 4.1 m. The troughs thus made develop no cracks as there is no tensile stress left. The article cites the following names and organizations connected with the new trough development: Engineer A.A. Gabuniya, Gruz-NIIGiM, Samgorskaya orositel'naya sistema

TITLE:

The Reduction of the Defects in the Performance of an Automatic Piezometric Densimeter (Concentration Meter)

PERIODICAL:

Priborostroyeniye, 1959, Nr 9, pp 28-29 (USSR)

ABSTRACT:

In investigations on the automatic control of phosphoric acid extraction from apatite by the sulfuric acid method a piezometric densimeter type DPM (construction OKB) of the Gosudarstvennyy Komitet Soveta Ministrov SSSR po khimii (State Committee of the Council of Ministers USSR for Chemistry) was used. Results obtained in testing the densimeter type DPM-3 with the constructive design OKB are given in a table. The wide fluctuation range (up to 7.5% of full deflection) of the second instrument is striking. It was undesirable to reduce the oscillation deflections in order to avoid delay. The densimeter operates with an error not exceeding 4% of full deflection. This error is accepted as limit of accuracy for the operation of this densimeter. It is, however, very unsatisfactory, and the authors therefore undertook to find the sources of error and inaccuracy in the operation of the densimeter. The pipe which conducts air into the minus tube has a much larger volume than

Card 1/2

The Reduction of the Defects in the Performance of an Automatic Piezometric Densimeter (Concentration Meter) SOV/119-59-9-15/19

the plus tube. When air of an equal pressure is applied to both tubes, this buffer capacity thus prevents the air bubbles from constantly creeping through from the second bubbling minus tube. This is the reason for the considerable fluctuations of the deflections in the secondary instrument. These fluctuations can be eliminated without application of a damper, by introducing more air into the minus tube than into the plus tube. However, this procedure is complicated and inaccurate. More stable and exact operation of the densimeter could be accomplished by attaching a compensating volume, to equate the volumes of the air line pipes of the minus and plus tube. In this case the quantities of air passing into both tubes are equal and the instrument may be returned to its initial adjustment after repeated tuning simply by counting the air bubbles. As is apparent from a table, the performance of such a densimeter is very stable and accurate. The author was able to reduce the error to 2% and less, and attained good agreement between the deflections of the instrument and density controls of the fluid in question by means of a hydrometer. There are 1 figure and 2 tables.

Investigated interuterine infection of fetuses of guinea pigs by subject fever when mothers were infected at different periods of pregnancy. Checked newborn guinea pigs for first 10 days of life for spirochetes, and blood of stillborn guinea pigs or those which died shortly after birth. When pregnant guinea pigs were infected within a period less than the incubation period of spirochetes before birth of young guinea pigs, no spirochetes were found in the young. Found fetuses and young guinea pigs from immunized mothers were not infected by homological strains of spirochetes before birth or for first few days of life but soon lost their resistance. Both mothers and fetuses could be infected by heterological strains. Demonstrated subject spirochetes were not transmitted by mother's milk to the young. Discusses bearing on human infection with this type of disease and human interuterine infection with spirochetes in general. Submitted 7 Apr 50.

Title : Detection of New Breeding Foci of Ticks *Ornithodoros talaje* Guerin-Meneville, 1849, in USSR.

Orig Pub : Dokl. AN SSSR, 1956, 109, No 1, 238-240

Abstract : In bird-colony nests of cormorants (*Phalacrocorax carbo*), sea-gulls (*Larus ichtyaetus*), and pelicans, ticks were found in masses and identified as *O. talaje* on two desert islands of a large lake in middle Asia. Numerous deposits of eggs, males, females and nymphs of these ticks (up to 1500-8000 items) were located in the middle fairly humid layer of the nest. From 5 to 1000 specimens of larvae were found on chicks of sea-gulls and cormorants. Ticks and their deposits were also found under stones on the ground.

TITLE: Mechanism of <sup>15</sup> film formation by water-soluble alkyd resins <sup>15, 44.55</sup>

SOURCE: Lakokrasochnyye materialy i ikh primeneniye, no. 4, 1965, 22-26

TOPIC TAGS: resin, pentaerythritol, aliphatic carboxylic acid, phthalic anhydride

ABSTRACT: An investigation is made of the mechanism governing the conversion of salts of nitrogenous bases and acid alkyd resins in the course of film formation at 110, 150, and 170C. The process is studied on a pentaphthalic resin of the following composition (moles): pentaerythritol 1, synthetic fatty acids of the C10-C16 fraction 1, phthalic anhydride 1; it is shown to involve decomposition of the salts of nitrogenous bases with regeneration of carboxyl groups, which react with the hydroxyl groups of the resin, and the formation of amide bonds. Triethylamine and ammonia are most suitable for the neutralization. Water-soluble alkyd resins can be cured with water-soluble alkoxy-methylmelamines. The degree of conversion into a three-dimensional structure depends on the type of nitrogenous  
Card 1/2

3

base employed. When unsaturated fatty acids are introduced into the resin composition, water-soluble resins are obtained which form a three-dimensional structure in the presence of desiccants. The degree of conversion depends on the type of nitrogenous bases and duration of film formation. "The authors thank L. L. Belayts for recording the infrared spectra." **AUTHORS:** Petrova, Ye.N. and Chagin, N.M. (Moscow)

**TITLE:** Protection of Windings of Electrical Machinery from Breakdowns (Zashchita obmotok elektromashin ot proboya)

**PERIODICAL:** Izvestiya Akademii Nauk SSSR, Otdeleniye Tekhnicheskikh Nauk, 1958, Nr 4, pp 90 - 91 (USSR)

**ABSTRACT:** Breakdown of high-voltage insulation is usually preceded by oxidation of the material of the conductors and this indicates that the purely physical phenomenon of breakdown is preceded by chemical phenomena. The authors of this paper investigated the ignition coil of a motor-car. Usually, ignition coils fail as a result of breakdown in the turns near to the core. This breakdown is preceded by the conductor turning green, which indicates that oxidation processes proceed in the area of the densest magnetic flux of the coil; this is confirmed by intensive corrosion of the core itself, which is made of annealed steel strip. The fact that the conductors are subject to oxidation in the field of the most intensive magnetic flux leads to the assumption that this phenomenon is associated with the paramagnetic properties of oxygen molecules which are drawn into the magnetic field of the

Card1/5

SOV/24-58-4-15/39

Protection of Windings of Electrical Machinery from Breakdowns

solenoid. This process is most intensive where the potential of the magnetic field is highest. As a result of the silent discharge, the oxygen inside the solenoid becomes transformed into ozone. Ozone, being a diamagnetic gas, is ejected from the solenoid and, on its path, oxidises the weak parts of the insulation. Probably, in the oxidation reaction of the insulation, the coefficient equals unity, i.e. it proceeds according to the formula:

The molecular oxygen obtained during this reaction is drawn in or simply remains in the coil where it becomes again transformed into ozone. Thus, it can be assumed that due to the effects of the magnetic field of the solenoid and the silent discharge, the oxygen of the air becomes transformed into ozone which oxidises the insulation and the conductor materials.

For determining the quantity of ozone, the authors applied an instrument, a sketch of which is reproduced in the paper; a coil 1 was enclosed in a space 2 ,

Card2/5

SOV/24-58-4-15/39

Protection of Windings of Electrical Machinery from Breakdowns

which was isolated from the surrounding medium by two hydraulic seals 3 and 4 which contained a 5% solution of potassium iodide for absorbing the ozone ejected by the solenoid. These hydraulic seals permit entry of air from the surrounding space along the path 5, when the oxygen inside the space has been consumed. Experiments were also made with coils for which the paper insulation between the layers was not impregnated with a liquid dielectric. The secondary coil of such ignition windings was impregnated for several days with a 5% potassium iodide solution, to which a 1% starch solution was added in the volume ratio 1:10. After impregnation the coil was dried in a thermostat at 95 - 100 °C and subjected to tests. This experiment has shown conclusively that at the spots where the magnetic field is the strongest, i.e. near to the core, an intensive evolution of ozone takes place. The initial (internal) layers of the coil gave a clear indication of the presence of ozone, whilst no ozone could be detected in the other layers of the winding. On cutting open such a coil, the interlayer paper insulation

Card3/5

SOV/24-58-4-15/39

Protection of Windings of Electrical Machinery from Breakdowns

of four layers of <sup>the</sup>winding, located near to the core, showed clearly visible intensive violet bands, i.e. traces of the path of movement of the ozone inside the solenoid; no such bands were detected at the middle and outside layers. Investigation of such ignition coils showed that the quantity of the ozone ejected by the coil depends on the intensity of the magnetic flux. The coil without a core ejects two to three times less ozone than one with a fitted core and with a polychlorvinyl insulation film. Coating of the core with a plastic substance was effected for the purpose of preventing loss of ozone due to its consumption for oxidation of the steel sheet. Increase of the ozone generation in the coil with a fitted core is attributed to the fact that the core concentrates the magnetic flux and thus also increases the oxygen "breezing" of the coil. It can be seen from the data entered in the table, giving the quantity of ozone generated by the secondary winding of the coil, in  $\text{cm}^3/\text{h}$ , that the cause of failure of the insulation of the winding of a solenoid (motor-car ignition coil) is the oxidation effect of ozone, produced by the silent discharges from oxygen molecules, which are drawn into the coil

Card4/5

SOV/24-58-4-15/39

Protection of Windings of Electrical Machinery from Breakdowns

by the magnetic lines of force. Similar phenomena are likely to be observed also in coils of transformers and other electrical apparatus and machines. Addition of colophony to the liquid dielectric used for impregnating coils protects the insulation against oxidation because this substance oxidises very easily and absorbs the oxidation effects of the ozone, thus protecting the insulation.

P. N. Dzerzhinskogo  
Avtomaticheskoye rotornyye lini - sredstvo komplekhnogo avtomatizatsii  
proizvodstva. (Rotary-Transfer-Machine Lines-a Means of Full  
Automation of Production) Moscow, Mashizt, 1960. 221 p. 10,000  
copies printed.

Ed. i L. M. Koshkina; Ed. of Publishing House: I. Vasil'yeva; Tech.  
Ed. i G. V. Smirnova; Managing Ed. for Literature on Metalworking  
and Machine-Tool Making: V. I. Mikhin, Engineer.

PURPOSE: The book is intended for technical personnel in the machin-  
ery industry.

COMMENT: This collection of articles explains the principles of full  
automation based on the use of rotary transfer machines in various  
industries. The rotary operational transfer machines used for basic  
processing are discussed, and also the special power equipment and  
accessories for these machines and (Production) lines. No personalities are  
mentioned. There are no references.

Chagleev, P. On a certain orthonormalized sequence.  
Dokl. Akad. Sci. URSS. Ser. Math. [Izvestia Akad. Nauk  
SSSR] 10, 271-276 (1946). (Russian. English sum-  
mary)

The author shows that the system

$$f_n(x) = \{ \varphi_n(n) \}^{-1} \sum_{d|n} \mu(n/d) F(dx) \quad n \text{ odd}$$

is orthonormal in  $L^2(0, 1)$ . Here  $F(x) = 1$  ( $0 < x < 1/2$ ),  
 $F(x) = -1$  ( $1/2 < x < 1$ ),  $\mu(n)$  is the Mobius function and  
 $\varphi_n(n) = \sum_{d|n} \mu(n/d) d^2$ . The system is shown to be complete  
for the class of functions  $\lambda(x)$  (of period 1) belonging to  
 $L^2(0, 1)$  for which  $\lambda(1-x) = -\lambda(x)$  and  $\lambda(x) = \varphi_n(x)$ . The  
method employed is similar to one of [1], N. 1, p. 107  
[Ros. Math. [Math. Sbornik] N. S. 16, 58-65 (1945), 1, p.  
107, key 7, 865] whose orthonormal system is con-  
nected with  $\{\rho_n(x)\}$  by a simple relation. There are sev-  
eral misprints. R. A. Rankin (Cambridge, England).

Title : Biochemical Changes in Muscles During the Period of Rest  
after Physical Work.

Orig Pub : Ukr. biokhim. zh., 1957, 29, No 4, 450-457

Abstract : A number of rats were investigated in a state of relative rest (control), and a number immediately after 15 minutes of swimming in water at 30-32° and after a period of rest. The content of phosphocreatine in the muscles, decreasing sharply during work (by 60%), was quickly restored and after 30 minutes rest somewhat exceeded the initial level. Parallel to the decrease of the glycogen content, the level of lactic acid in the muscles and blood during work increased, and decreased in accordance with glycogen

restoration; furthermore, after  $\frac{1}{2}$ -1 hour of rest, its content in the muscles, and especially in the blood, turned out to be considerably lower than initially. The general activity of dehydrases under the influence of work increased and turned out to be the highest after 30 minutes of rest. A sharp increase of lactic dehydrogenase activity immediately after work was replaced by a decrease to the initial value after only 5 minutes of rest. The increase of activity of isocitric dehydrogenase was less expressed and was observed only after 30 minutes of rest, reaching maximum value after 2 hours. After 6 hours, normal activity was noted. ATP activity of muscles, increasing during work and especially after 5 minutes of rest, later decreased, reaching the initial level after 30 min. A decrease by 12% of total N content in muscles after work and during the first period of rest was replaced after

2 hours by the restoration of the initial level. Only  
after 24 hours was a normal amount of total N noted.  
The residual N of blood increased immediately after work  
and gradually returned to normal.

AUTHOR: Chagovets, R. K. and Borisjuk, Yu. G. 73-1-15/26

TITLE: Chemical Investigation of the Ester Oil of Field Mint.  
(Khimicheskoye Issledovaniye Efirnogo Maslya Polevoy Myaty.)PERIODICAL: Ukrainskiy Khimicheskii Zhurnal, 1957, Vol.23, No.1,  
pp. 82 - 84 (USSR).

ABSTRACT: Field mint, *Mentha Arvensis* L., occurs in the European part of the USSR and in Western Siberia. It is used for medicinal purposes. It was found that the leaves contained up to 0.34% of the ester oil, the stems up to 0.06%, the raceme up to 0.80% of the ester oil. The following substances were found in the ester oil:  $\alpha$ -pinene, leavortatory limonene, about 30% of tertiary unsaturated linabol, about 4% pulegone, 6% linalyl acetate and acetic acid. Physico-chemical constants were obtained from the fractional distillation of the ester oil: specific weight  $d_{20}^{20} = 0.8645$ , refraction coefficient  $n_D^{20} = 1.4728$ , polarisation angle  $\alpha_D^{20} = -3.3$ , acid number = 1.02, ester number = 23.2, ester number (after acetylation) = 102.2. Boiling points as well as the above constants for various fractions are given in table 1. Four fractions obtained during the distillation of the oxygen containing fractions of the ester oil were analysed. Results are tabulated in table 2. There are

**Effect of exercise and training on the oxidation-reduction potential of the muscle tissue. IV. Interrelationship between changes in the oxidation-reduction potential and  $p_{H_2}$  of the muscle in fatigue and after training.** Rost Chagovets. *Ukrain. Biochem. Zhur.* 9, 1005-14 (in Russian 1015, in English 1016) (1936); cf. C. A. 31, 3530\*.

Changes of  $E_2$  cannot be considered as a result of changes in the H-ion concn. No interdependence between  $E_2$  and  $p_{H_2}$  was noted during a 3-hr. expt. A decrease in the  $p_{H_2}$  was noted in the exts. and pulp of fatigued white muscles (biceps femoris) of a rabbit; a shift in the opposite direction is noted in the exts. and pulp of the trained muscle.

An electrometric study of the oxidation-reduction processes in muscle tissue in relation to its activity. Roost, slay V. Chagoyts. *J. Physiol. (U. S. S. R.)* 22, 534-41 (in English 545) (1937); cf. *C. A.* 31, 7498<sup>a</sup>.—The initial reduction potential of phosphate ext. from normal, fatigued and trained muscles of rabbits was 300, 430 and 500 mv., resp., when detd. in vacuo. In 3 hrs. the  $E_r$  fell in all cases to 30 mv. The high values in fatigued muscles are due to the accumulation of oxidized components of the oxidation-reduction system, while an increase in concn. of the reduced components is observed in training. In the muscles of trained rabbits under polarized electrodes a sharp drop in anode potential from the normal was observed in 45-60 min. With fatigued muscles under polarized electrodes an initial high cathode potential was observed which fell to normal in 60 min. S. A. K.

Change in the reduction potential of urine as a result of physical training exercises. Rostislav V. Chagovets, O. V. Koval'eva and A. D. Shevko. *Doklady Akad. Nauk SSSR* (Ukraine) 12, 253-75 (in Russian, 275-6; in English, 277-8) (1938).—The rH, the dichlorophenolindophenol reducing power and the vacat O of urine rise, and the pH falls, after exercise (wrestling, cycling). These results are ascribed to excretion of incompletely oxidized metabolites. R. C. P. A.

CA

Change in weight and dry matter content of muscles in connection with their function. R. V. Chagovets. *Biochem. J. (Ukraine)* 12, 427-32 (in Russian, 432-3; in English, 433-4) (1938). — The wt. of the biceps femoris muscle of one limb of rabbits differs from that of the other by not more than +3%. After fatiguing work, the wt. of the muscle rises by 8-33%, owing entirely to increased H<sub>2</sub>O content. Training increases the wt. of muscles by 0.2-22%, without however, affecting the H<sub>2</sub>O content. B. C. P. A.
